Apply SQL JOIN

Project description

The management at my organization has asked me to investigate potential security issues and update employee computers as required. As a Linux administrator, I used SQL with filters to perform security-related tasks. But for this scenario, I applied SQL join to play with the values of the two tables. This task is related to relational database management.

Inner Join

I created a SQL query on MariaDB to join two tables focusing on the intersection of two tables, where we only care about rows that have corresponding values in both.

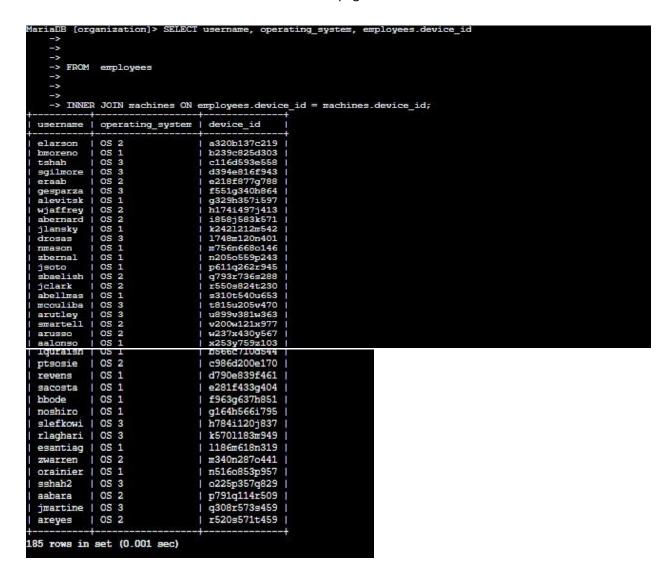

This is the "employees" table.

ariaDB [organ:	ization] > SELEC	T * FROM em	ployees;	10.000000000000000000000000000000000000

Inner join: This is the query that produces username, operating system, and employee ID from both tables. The username is from one of the tables and so is the operating system. For the table that can be found on both, we use "table.column" format to avoid ambiguity. In this case it is the employees table (employee ID). As the result goes, there are 185 usernames with respective operating systems and device IDs. Other variations can be found in the next pages of Inner Join.

This query will produce username, employee ID, operating system, device ID and their respective office.

Return More Data

Left Join: The results will include all records from one or the other table. Here, I have to link these tables using the common device_id column. In a left join, all records after FROM and before LEFT JOIN are included in the result. In this case, all records from the machines table are included, whether they are assigned to the employees table or not.

-> LEFT JOIN employees ON machines.device_id = employees.device_id;

```

Both produced 200 rows each, however in the process, some data are written $_{
m NUL}$ due to types of JOIN.

Summary

I wrote queries to join two tables in three different scenarios: Inner Join, Left Join, and Right Join.
